

Virtual Memory

- * ISA has large VA space.
 - Allows user to uniquely identify lots
- * Physical Memory is smaller
 - Cost issue
- * Virtual Memory Management
 - Access Control
 - Translation

* The VAX Model

Page Tables

- * One for each region
- * For example, the P0 Page Table

- * Sequentially stored in System Virtual Space
- * P0LR used for ACV checks
- * PTE used for ACV, TNV checks

The Abstraction

Which Page Table
 Example: ~~00~~ P~~0~~PT

① Is Page No. < P~~0~~LR?
NO: ACV Fault!

② Get Correct PTE

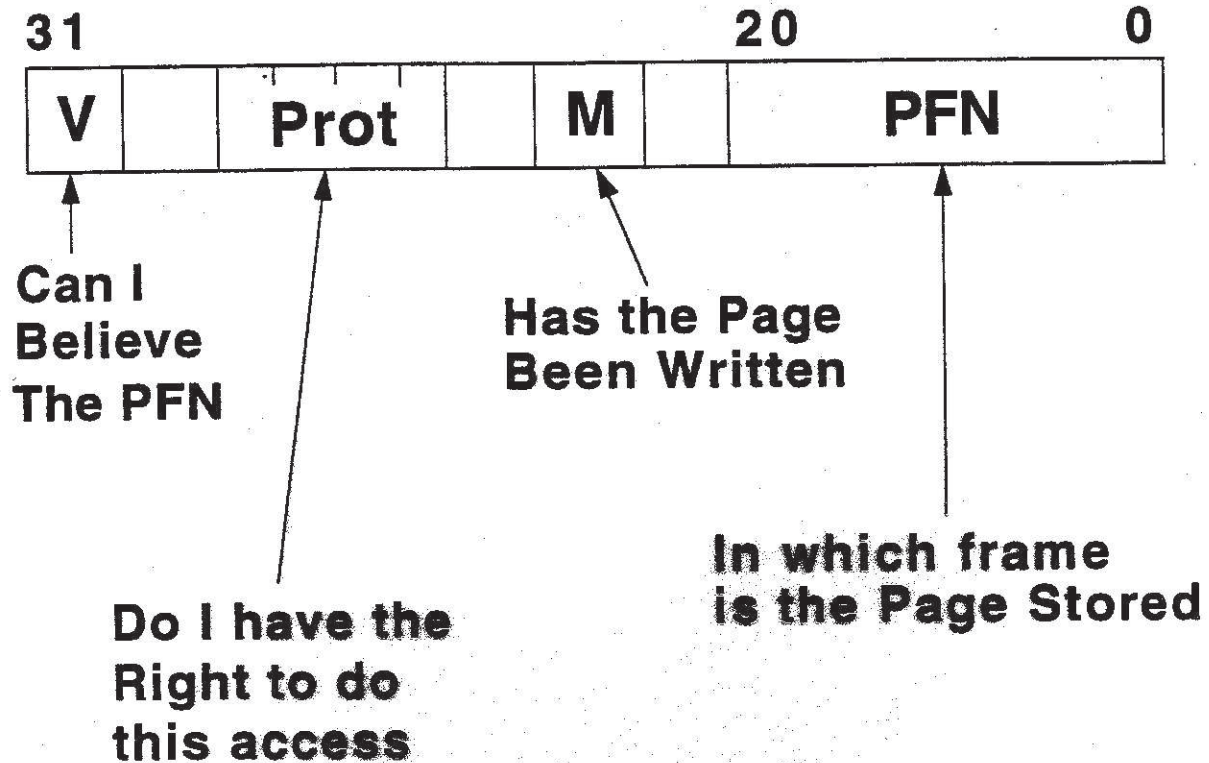

Check Protection
NO: ACV Fault!

④ Is Page Resident (i.e. V = 1)
NO: TNV Fault!

The PTE

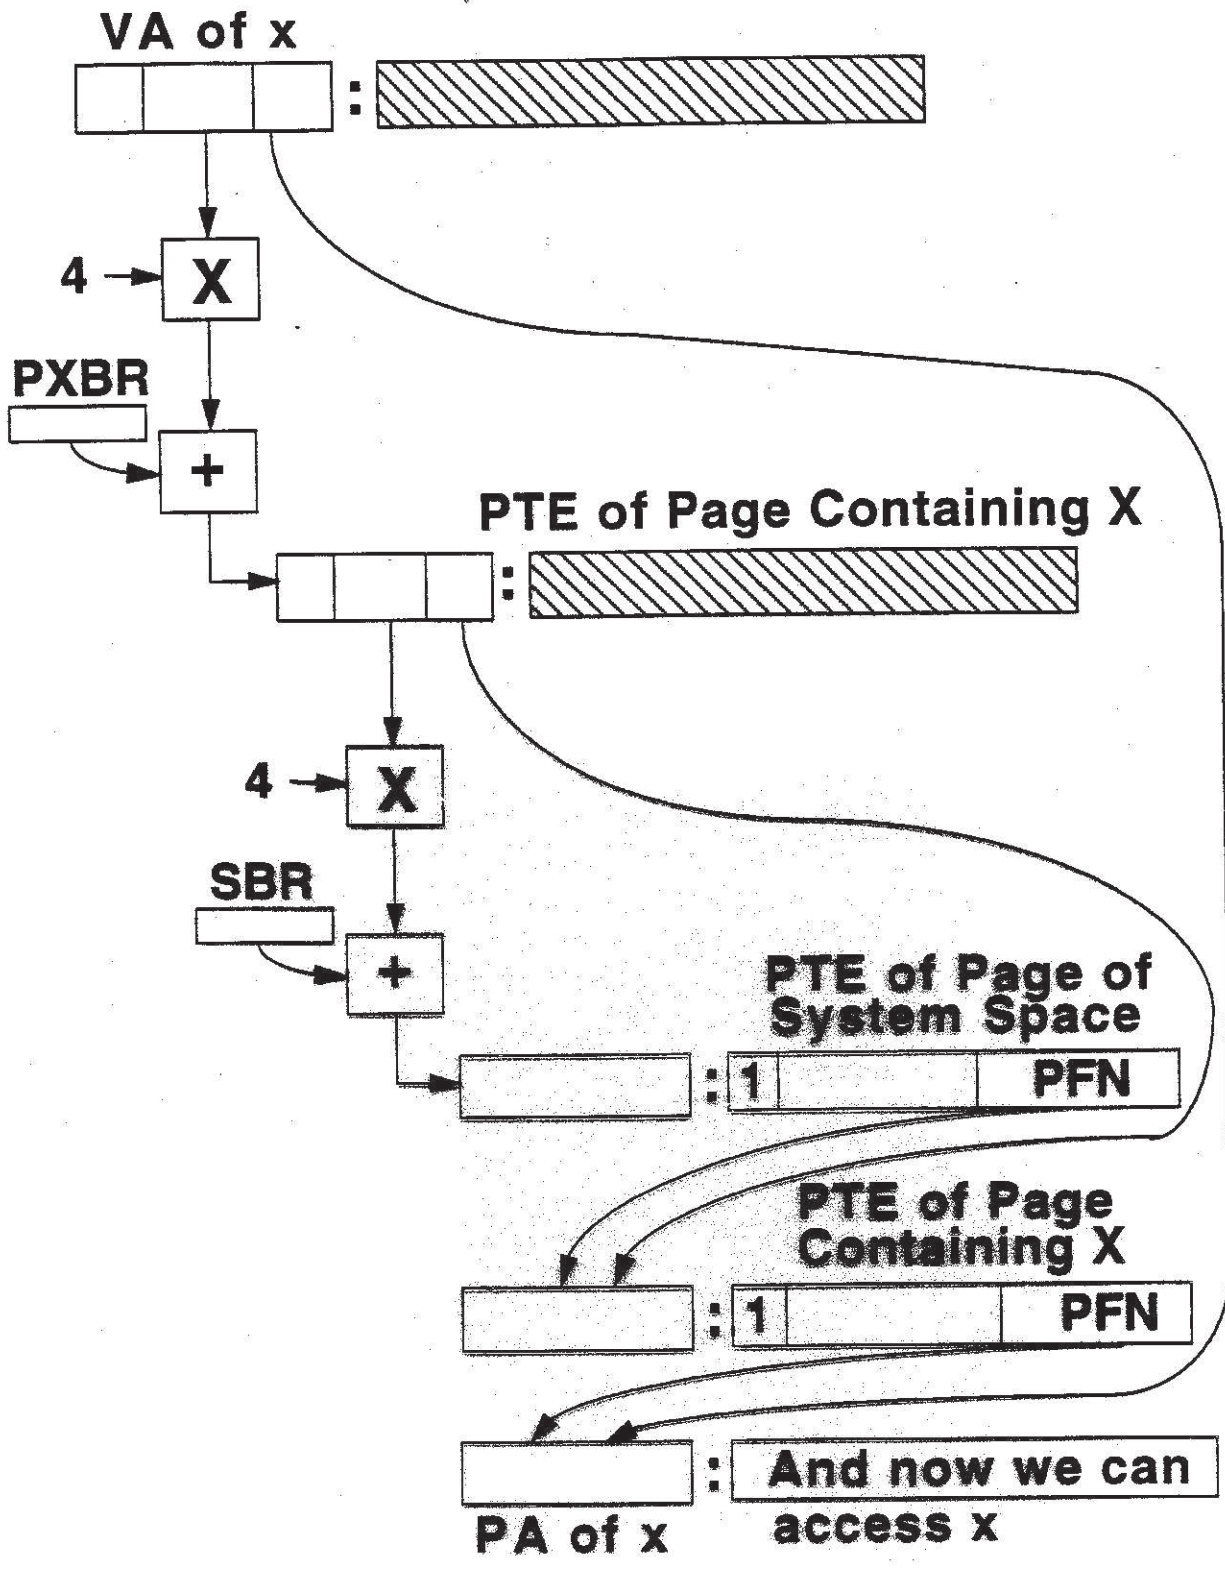

{NO, R, R/W} {K, E, S, U}

81 Possibilities
in 4 bits
?

Note:

No Ref. Bit!

VA of x

PXBR

PTE of Page Containing X

SBR

PTE of Page of System Space

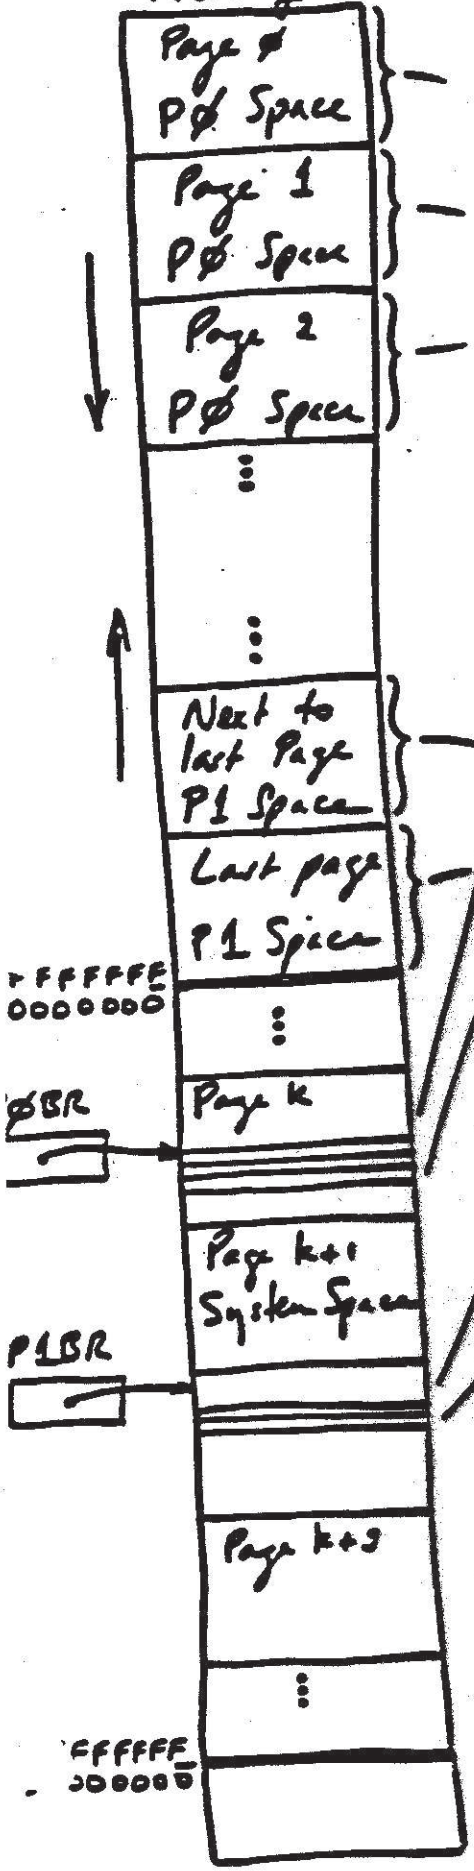

PTE of Page Containing X

PA of x : **And now we can access x**

VAX HARDWARE MEMORY MGT.

(ASSUMING 9 bit VA Space)

16 pages, 32 bytes each

Example:

VA of a Byte X on Page 1, P \emptyset Space

1 = Page 1 of P \emptyset Space. We need to find the VA of the PTE of Page 1, P \emptyset Space.

100100000
P \emptyset BR

100100100
VA of the PTE of Page 1, P \emptyset Space

1 = Page 1 of System Space. We need to find the PTE of the Page 1 of System Space

10000000
SBR

10000100 PA of Page 1, PTE of Page 1, System Space

PFN of Page 1 System Space

PA of PTE of Page 1, P \emptyset Space

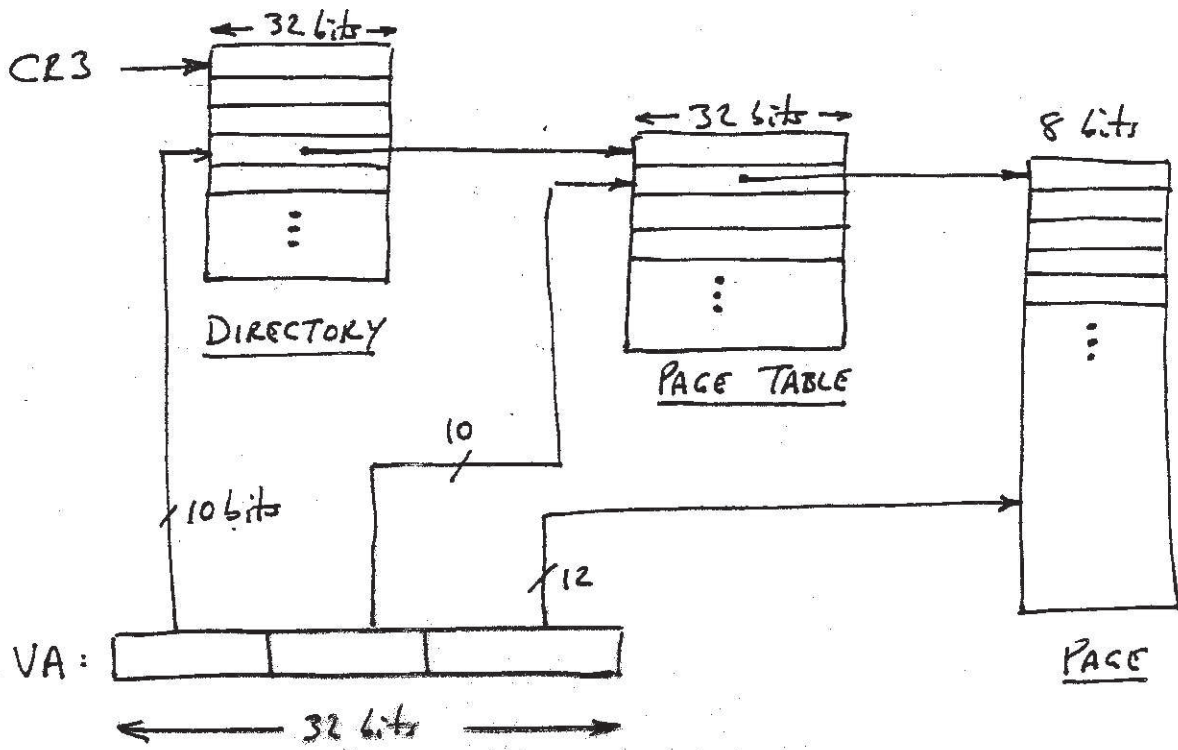

PFN of Page 1, P \emptyset Space

PA of X
