Signature: ___________________________________________________________________

Instructions:

- Closed book and closed notes.
- No calculators or any electronic devices (turn cell phones off).
- You must put your answers on pages 2-6 only.
- You have 50 minutes, so allocate your time accordingly.
- Show your work, and put your answers in the boxes.
- Please read the entire quiz before starting.
(3) Question 1. Which of the following statements is most true? If we wished to reduce the power consumption used by our microcontroller
A) we could increase the operating voltage?  
B) we could decrease the frequency of the bus clock?  
C) we could set bits in the DEN register for unused pins?  
D) none of A B or C is correct  
E) A B and C are all correct

(4) Question 2. Digital logic currently uses binary because it is fast, low power, and very small. In the future, an EE319K student invents ternary logic that is faster, smaller and lower power than binary. This means each ternary digit can be 0, 1, or 2. Ternary means base 3 in the same way binary means base 2. What are the four basis elements of unsigned four-digit ternary number? Give your answers as a decimal numbers.  

(3) Question 3. Consider the following 8-bit subtraction (assume registers are 8 bits wide)
Load 0x32 into R1  
Load 0x9C into R2  
Subtract R3 = R1-R2  
What will be the 8-bit result in Register R3?  

What will be the value of the overflow (V) bit?  

What will be the value of the carry (C) bit?
(20) **Question 4.** Interface the LED to PA0 in positive logic. The desired LED operating point is 1.0V at 2 mA. At 2 mA you can assume the $V_{OL}$ of the 7406 will be 0.5 V. Assume the output high voltage of the microcontroller is 3.2 V and the output low voltage is 0.1V. Interface the switch to PB0 using positive logic. No software is required in this question, and you may assume PA0 is an output and PB0 an input. Assume the pull-down feature of PB0 will be activated by software. Your bag of parts includes the switch, the 7406, the LED, and resistors (you specify the values). Pick the fewest components to use (you may or may not need them all.) You may also use 3.3V, 5V power and ground.

![Diagram of LM3S, PA0, 7406, and LED](image)

(15) **Question 5.** Write an assembly subroutine that selects bit 8. The input to the subroutine is a 32-bit number in R0. The output in R0 is 0 if the input bit 8 is 0, and the output is 1 if the input bit 8 is 1.
(5) **Question 6.** Write C function that selects bit 8. The input to the function is an unsigned 32-bit number. The output of the function is 0 if the input bit 8 is 0, and the output is 1 if the input bit 8 is 1.

For questions 7 and 8, don’t worry about establishing the reset vector, creating a main program, or initializing the stack pointer. You may use RAM-based global variables. Bit-specific addressing is allowed but not required. You may use the following definitions

- `GPIO_PORTB_DATA_R` EQU 0x400053FC
- `GPIO_PORTB_DIR_R` EQU 0x40005400
- `GPIO_PORTB_AFSEL_R` EQU 0x40005420
- `GPIO_PORTB_DEN_R` EQU 0x4000551C
- `SYSCTL_RCGCGPIO_R` EQU 0x400FE608
- `SYSCTL_RCGCGPIO_GPIOB` EQU 0x00000002 ; port B Clock Gating Control

(10) **Question 7.** Fill in the boxes with hexadecimal numbers that initialize Port B. Bits 0, 1, and 2 are input. Bits 3 and 5 are output.

```c
PortB_Init
LDR R1, =SYSCTL_RCGCGPIO_R
LDR R0, [R1]
ORR R0, R0, #----------------------------------------------/\---
STR R0, [R1]
NOP
LDR R1, =GPIO_PORTB_DIR_R
LDR R0, [R1]
ORR R0, R0, #----------------------------------------------/
BIC R0, R0, #----------------------------------------------\----
STR R0, [R1]
LDR R1, =GPIO_PORTB_AFSEL_R
LDR R0, [R1]
BIC R0, R0, #----------------------------------------------\---
STR R0, [R1]
LDR R1, =GPIO_PORTB_DEN_R
LDR R0, [R1]
ORR R0, R0, #----------------------------------------------
STR R0, [R1]
BX  LR
```
(30) **Question 8.** Write an assembly language main program that first calls the initialization and then performs steps 2, 3, and 4 over and over infinitely.

1) execute `PortB_Init` defined in Question 7.
2) read the inputs;
3) if all three inputs are equal to each other (inputs are 000 or 111) then toggle output bit 3,
4) otherwise (inputs are 001, 010, 011, 100, 101, or 110) toggle output bit 5.

Write friendly code. Comments are allowed but not needed.
(10) Question 9. Write a C language main program that first calls the initialization and then performs steps 2, 3, and 4 over and over infinitely.

1) execute `PortB_Init();` defined in Question 7.
2) read the inputs;
3) if all three inputs are equal to each other (inputs are 000 or 111) then toggle output bit 3,
4) otherwise (inputs are 001, 010, 011, 100, 101, or 110) toggle output bit 5.

Write friendly code. Comments are allowed but not needed. With this definition

```c
#define PORTB (*((volatile uint32_t *)0x400053FC))
```

You will be able to read and write to Port B. For example
```
n = PORTB;  // reads all 8 bits of Port B into variable n
PORTB = m;  // write all 8 bits of Port B with data from m
```
Memory access instructions

\begin{verbatim}
LDR Rd, [Rn]    ; load 32-bit number at [Rn] to Rd
LDR Rd, [Rn,#off] ; load 32-bit number at [Rn+off] to Rd
LDR Rd, =value ; set Rd equal to any 32-bit value (PC rel)
LDRH Rd, [Rn]   ; load unsigned 16-bit at [Rn] to Rd
LDRH Rd, [Rn,#off] ; load unsigned 16-bit at [Rn+off] to Rd
LDRSH Rd, [Rn]  ; load signed 16-bit at [Rn] to Rd
LDRSH Rd, [Rn,#off] ; load signed 16-bit at [Rn+off] to Rd
LDRB Rd, [Rn]   ; load unsigned 8-bit at [Rn] to Rd
LDRB Rd, [Rn,#off] ; load unsigned 8-bit at [Rn+off] to Rd
STR Rt, [Rn]    ; store 32-bit Rt to [Rn]
STR Rt, [Rn,#off] ; store 32-bit Rt to [Rn+off]
STRH Rt, [Rn]   ; store least sig. 16-bit Rt to [Rn]
STRH Rt, [Rn,#off] ; store least sig. 16-bit Rt to [Rn+off]
STRB Rt, [Rn]   ; store least sig. 8-bit Rt to [Rn]
STRB Rt, [Rn,#off] ; store least sig. 8-bit Rt to [Rn+off]
PUSH {Rt}       ; push 32-bit Rt onto stack
POP {Rd}        ; pop 32-bit number from stack into Rd
ADR Rd, label  ; set Rd equal to the address at label
MOV{S} Rd, <op2> ; set Rd equal to op2
MOV Rd, #im16   ; set Rd equal to im16, im16 is 0 to 65535
MVN{S} Rd, <op2> ; set Rd equal to -op2
\end{verbatim}

Branch instructions

\begin{verbatim}
B label ; branch to label Always
BEQ label ; branch if Z == 1 Equal
BNE label ; branch if Z == 0 Not equal
BCS label ; branch if C == 1 Higher or same, unsigned \geq
BHS label ; branch if C == 1 Higher or same, unsigned \geq
BCC label ; branch if C == 0 Lower, unsigned <
BLT label ; branch if C == 0 Lower, unsigned <
BMI label ; branch if N == 1 Negative
BPL label ; branch if N == 0 Positive or zero
BVS label ; branch if V == 1 Overflow
BVC label ; branch if V == 0 No overflow
BHI label ; branch if C==1 and Z==0 Higher, unsigned >
BLS label ; branch if C==0 or Z==1 Lower or same, unsigned \leq
BGE label ; branch if N == V Greater than or equal, signed \geq
BLT label ; branch if N != V Less than, signed <
BGT label ; branch if Z==0 and N==V Greater than, signed >
BLE label ; branch if Z==1 or N!=V Less than or equal, signed \leq
BX Rm ; branch indirect to location specified by Rm
BL label ; branch to subroutine at label
BLX Rm ; branch to subroutine indirect specified by Rm
\end{verbatim}

Interrupt instructions

\begin{verbatim}
CPSIE I ; enable interrupts (I=0)
CPSID I ; disable interrupts (I=1)
\end{verbatim}

Logical instructions

\begin{verbatim}
AND{S} {Rd,} Rn, <op2> ; Rd=Rn&op2 \quad (op2 is 32 bits)
ORR{S} {Rd,} Rn, <op2> ; Rd=Rn|op2 \quad (op2 is 32 bits)
EOR{S} {Rd,} Rn, <op2> ; Rd=Rn^op2 \quad (op2 is 32 bits)
BIC{S} {Rd,} Rn, <op2> ; Rd=Rn&(~op2) \quad (op2 is 32 bits)
ORN{S} {Rd,} Rn, <op2> ; Rd=Rn|(~op2) \quad (op2 is 32 bits)
\end{verbatim}
LSR(S) Rd, Rm, Rs ; logical shift right Rd=Rm>>Rs (unsigned)
LSR(S) Rd, Rm, #n ; logical shift right Rd=Rm>>n  (unsigned)
ASR(S) Rd, Rm, Rs ; arithmetic shift right Rd=Rm>>Rs (signed)
ASR(S) Rd, Rm, #n ; arithmetic shift right Rd=Rm>>n  (signed)
LSL(S) Rd, Rm, Rs ; shift left Rd=Rm<<Rs (signed, unsigned)
LSL(S) Rd, Rm, #n ; shift left Rd=Rm<<n  (signed, unsigned)

Arithmetic instructions
ADD(S) {Rd,} Rn, <op2> ; Rd = Rn + op2
ADD(S) {Rd,} Rn, #im12 ; Rd = Rn + im12, im12 is 0 to 4095
SUB(S) {Rd,} Rn, <op2> ; Rd = Rn - op2
SUB(S) {Rd,} Rn, #im12 ; Rd = Rn - im12, im12 is 0 to 4095
RSB(S) {Rd,} Rn, <op2> ; Rd = op2 - Rn
RSB(S) {Rd,} Rn, #im12 ; Rd = im12 – Rn
CMP Rn, <op2> ; Rn - op2 sets the NZVC bits
CMN Rn, <op2> ; Rn - (-op2) sets the NZVC bits
MUL(S) {Rd,} Rn, Rm ; Rd = Rn * Rm signed or unsigned
MLA Rd, Rn, Rm, Ra ; Rd = Ra + Rn*Rm signed or unsigned
MLS Rd, Rn, Rm, Ra ; Rd = Ra - Rn*Rm signed or unsigned
UDIV {Rd,} Rn, Rm ; Rd = Rn/Rm unsigned
SDIV {Rd,} Rn, Rm ; Rd = Rn/Rm signed

Notes Ra Rd Rm Rn Rt represent 32-bit registers
value any 32-bit value: signed, unsigned, or address
{S} if S is present, instruction will set condition codes
#im12 any value from 0 to 4095
#im16 any value from 0 to 65535
{Rd,} if Rd is present Rd is destination, otherwise Rn
#n any value from 0 to 31
#off any value from -255 to 4095
label any address within the ROM of the microcontroller
op2 the value generated by <op2>

Examples of flexible operand <op2> creating the 32-bit number. E.g., Rd = Rn+op2
ADD Rd, Rn, Rm ; op2 = Rm
ADD Rd, Rn, Rm, LSL #n ; op2 = Rm<<n Rm is signed, unsigned
ADD Rd, Rn, Rm, LSR #n ; op2 = Rm>>n Rm is unsigned
ADD Rd, Rn, Rm, ASR #n ; op2 = Rm>>n Rm is signed
ADD Rd, Rn, #constant ; op2 = constant, where X and Y are hexadecimal digits:
- produced by shifting an 8-bit unsigned value left by any number of bits
- in the form 0x00XY00XY
- in the form 0xXY00XY00
- in the form 0xXYXYXYXY

Condition code bits
N negative
Z zero
V signed overflow
C carry or unsigned overflow

256k Flash ROM
64k RAM
I/O ports
Internal I/O PPB
