2. Why another optimization text?

- Many texts focus on the design of algorithms.
- Many engineering students are involved with *formulating* a problem:
 - expectation is to utilize existing algorithms and software for solution.
- The “scarce resource” is increasingly in formulation, not hardware or optimization software itself.
- This book focuses on formulation of problems.

3. Problem classes

- Continuous variables and functions.
- Incrementally defines and discusses:
 1. linear systems of equations,
 2. non-linear systems of equations,
 3. unconstrained optimization,
 4. equality-constrained optimization,
 5. inequality-constrained optimization.

4. Formulation of problems

- The book presents engineering applications through a series of fourteen detailed case studies.
- The case studies illustrate:
 - formulation of simultaneous equations and optimization problems,
 - transformation of problem formulations,
 - solution of problems with existing general-purpose software, and
 - incremental development of formulations.
- Simultaneous equations problems are covered in detail since many signal processing and other engineering applications involve the solution of equations.
 - Solution of optimality conditions for optimization problems builds directly on solution of simultaneous equations.

6. Algorithms

- One or two exemplar algorithms are introduced for each problem class to illustrate the issues that arise in formulating problems.
- Emphasize:
 - monotonicity,
 - convexity,
 - problem transformations,
 - symmetry, and
 - sparsity.
- Avoid details that are not prominent in problem formulation:
 - variations and extensions introduced briefly.

7. Organization

- Three introductory chapters outline the problem classes and discuss problem transformations.
- The remaining chapters are organized in five Parts.
- Each Part deals with a problem class and consists of chapters describing:
 - formulation of at least two case studies,
 - algorithms to solve the problem class,
 - sensitivity analysis, and
 - solution of the case studies.
- Each chapter has a number of homework exercises:
 - Over three hundred pages of homework solutions available to instructors.

8. Level of development

- Aimed at incoming graduate students or senior undergraduates.
- Formal discussion in definition–theorem–proof style.
- Complemented by:
 - considerable discussion,
 - many worked examples, and
 - about 200 figures.

9. Software

- The MATLAB Optimization Toolbox is used in some of the homework exercises.
- Other frameworks are possibly better suited to formulation and solution of optimization problems.
- MATLAB is used by many engineering students in their research:
 - minimizes the “start-up” costs of learning new packages, and
 - enables direct incorporation of optimization formulations into research projects.

10. Additional materials

- Available from www.cambridge.org/9780521855648
1. Mathematical background.
 2. Proofs of results.
 3. Slides that I use in teaching this course.
 4. Over four hundred pages of homework solutions available to instructors.

11. Conclusion

- New book on solving equations and continuous optimization.
- Emphasizes formulation of problems and transformations.
