

## *Introduction to Computation in Matlab*

*Prof. Brian L. Evans, Dept. of ECE, The University of Texas, Austin, Texas USA*

Matlab's forte is numeric calculations with matrices and vectors. A vector can be defined as

```
vec = [1 2 3 4];
```

The first element of a vector is at index 1. Hence, `vec(1)` would return 1. A way to generate a vector with all of its 10 elements equal to 0 is

```
zerovec = zeros(1,10);
```

Two vectors, **a** and **b**, can be used in Matlab to represent the left hand side and right hand side, respectively, of a linear constant-coefficient difference equation:

$$a(3) y[n-2] + a(2) y[n-1] + a(1) y[n] = b(3) x[n-2] + b(2) x[n-1] + b(1) x[n]$$

The representation extends to higher-order difference equations. Assuming zero initial conditions, we can derive the transfer function. The transfer function can also be represented using the two vectors **a** (negated feedback coefficients) and **b** (feedforward coefficients). For the second-order case, the transfer function becomes

$$H(z) = \frac{b(1) + b(2)z^{-1} + b(3)z^{-2}}{a(1) + a(2)z^{-1} + a(3)z^{-2}}$$

We can factor a polynomial by using the `roots` command.

Here is an example of values for vectors **a** and **b**:

```
a = [ 1  6/8  1/8];  
b = [ 1  2  3 ];
```

For an asymptotically stable transfer function, i.e. one for which the region of convergence includes the unit circle, the frequency response can be obtained from the transfer function by substituting  $z = \exp(j\omega)$ . The Matlab command `freqz` implements this substitution:

```
[h, w] = freqz(b, a, 1000);
```

The third argument for `freqz` indicates how many points to use in uniformly sampling the points on the unit circle. In this example, `freqz` returns two arguments: the vector of frequency response values **h** at samples of the frequency domain given by **w**. One can plot the magnitude response on a linear scale or a decibel scale:

```
plot(w, abs(h));  
plot(w, 20*log10(abs(h)));
```

The phase response can be computed using a smooth phase plot or a discontinuous phase plot:

```
plot(w, unwrap(angle(h)));  
plot(w, angle(h));
```

One can obtain help on any function by using the `help` command, e.g.

```
help freqz
```

As an example of defining and computing with matrices, the following lines would define a 2 x 3 matrix **A**, then define a 3 x 2 matrix **B**, and finally compute the matrix **C** that is the inverse of the transpose of the product of the two matrices **A** and **B**:

```
A = [1 2 3; 4 5 6];  
B = [7 8; 9 10; 11 12];  
C = inv((A*B)');
```

### **Matlab Tutorials, Help and Training**

Here are excellent Matlab tutorials:

<https://stat.utexas.edu/training/software-tutorials#matlab>

[http://www.mathworks.com/academia/student\\_center/tutorials/mltutorial\\_launchpad.html](http://www.mathworks.com/academia/student_center/tutorials/mltutorial_launchpad.html)

The following Matlab tutorial book is a useful reference:

Duane C. Hanselman and Bruce Littlefield, *Mastering MATLAB*, ISBN 9780136013303, Prentice Hall, 2011.

A full version of Matlab is available for your personal computers via a university site license:

<https://users.ece.utexas.edu/~bevans/courses/realtime/homework/matlab.html>

The first few homework assignments will help step you through Matlab.

Technical support is provided through [free consulting services](#) from the Department of Statistics and Data Sciences. Simple queries can be e-mailed to [stat.consulting@austin.utexas.edu](mailto:stat.consulting@austin.utexas.edu). You can book an appointment via the [free consulting services](#) page.
