ECE445M/ECE380L.12

5

## Threads and Tasks

```
void Producer(void) {
    uint16_t data;
    while(1) {
        data = ADC_In();
        if(OS_Fifo_Put(data) == 0)
            DataLost++;
    }
}
```

```
void Display(void) {
    uint16_t data, voltage;
    while(1){
        data = OS_MailBox_Recv();
        voltage = 31*data/64;
        LCD_Message(0,"v(mV) =",voltage);
    }
}
```

```
void Consumer(void) {
    uint16_t data, average;
    uint32_t sum;
    uint16_t n;
    while(1) {
        sum = 0;
        for(n = 0; n < LENGTH; n++) {
            data = OS_Fifo_Get();
            sum = sum + data;
        }
        average = sum/LENGTH;
        OS_MailBox_Send(average);
    }
}
```

ECE445M/ECE380L.12

6

## Multi-Threading / Multi-Tasking

Thread: Same program & data

Task: Independent program & data (= process\*\*)

\*\* More in Lecture 7

Lecture 2

J. Valvano, A. Gerstlauer  
ECE445M/ECE380L.12

7

## Thread Classification

- Periodic, execution at regular intervals
  - E.g., ADC, DAC, motor control
  - E.g., Check CO levels
- Aperiodic, execution can not be anticipated
  - Execution is frequent
  - E.g., New position detected as wheel turns
- Sporadic, execution can not be anticipated
  - Execution is infrequent
  - E.g., Faults, errors, catastrophes

Lecture 2

J. Valvano, A. Gerstlauer  
ECE445M/ECE380L.12

8

## Real-Time

- RT threads have deadlines
  - Hard real time
    - Guaranteed bounded latency
  - Firm real time
    - Missed deadline loss of quality
  - Soft real time
    - Delayed response reduces value
  - Not real time
    - Best effort, no deadlines whatsoever

Lecture 2

J. Valvano, A. Gerstlauer  
ECE445M/ECE380L.12

9

## Thread Management

- Basic thread management
  - Maintain thread states
    - Running/ready/waiting
  - Context switch
    - Switch running thread
  - Protection
    - OS kernel from threads
    - Threads from each other

Lecture 2

J. Valvano, A. Gerstlauer  
ECE445M/ECE380L.12

10

## Thread Scheduler

- Thread management
  - Thread states
- Scheduling algorithm
  - What? (order of threads)
    - Round robin
    - Weighted round robin
    - Priority
  - How? (when to decide)
    - Static
    - Dynamic
    - Deterministic/fixed
  - Why? (when to run)
    - Cooperative
    - Preemptive
- Performance measures
  - Utilization
  - Latency
  - Bandwidth

Lecture 2

J. Valvano, A. Gerstlauer  
ECE445M/ECE380L.12

11

## Time Management

- System time
- Time stamps
  - When did it occur?
    - Performance measures
- Thread sleeping
  - Yield and wakeup after certain delay
    - Run other tasks instead of busy waiting
- Measurements
  - Input capture period -> wheel RPM
  - Input capture PW -> ultrasonic distance

Lecture 2

J. Valvano, A. Gerstlauer  
ECE445M/ECE380L.12

12

## Additional OS Requirements

- Run-time configurable, extensible
  - Priority, stack size, fifo size, time slice
- Reliability, certification
  - Medical, transportation, nuclear, military
- Scalable
  - 10 threads versus 200 threads
- ROMable
  - Runs in ROM

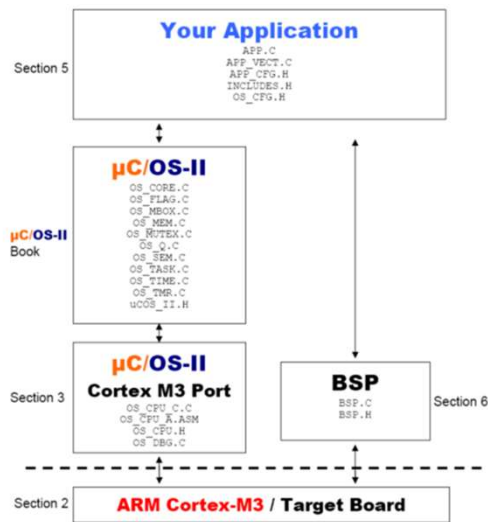

Lecture 2

J. Valvano, A. Gerstlauer  
ECE445M/ECE380L.12

13

## OS Architecture & Implementation

- Portability
  - Small kernel
  - Hardware abstraction layer (HAL)
  - Common structure
- Extensibility
  - Hooks

*uC/OS-II Application Note (AN-1018)*

Lecture 2

J. Valvano, A. Gerstlauer  
ECE445M/ECE380L.12

14

# Thread or Light-Weight Process

- Execution of a software task
- Has its own registers
- Has its own stack
- Local variables are private
- Threads cooperate for common goal
- Private global variables
  - Managed by the OS
  - Allocated in the TCB (e.g., `ld`)

Lecture 2

J. Valvano, A. Gerstlauer  
ECE445M/ECE380L.12

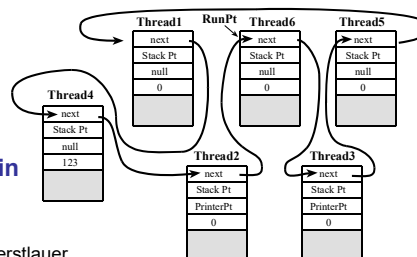

15

# Thread Control Block (TCB)

- `ld`
- Stack pointer
- Sleep counter
- Blocked pt (Lab 3)
- Priority (Lab 3)
- Next or Next/Previous links

*Where are the registers saved?*

```
struct TCB {
    // order??. types??
};
typedef struct TCB TCBType;
typedef TCBType * TCBPtr;
```

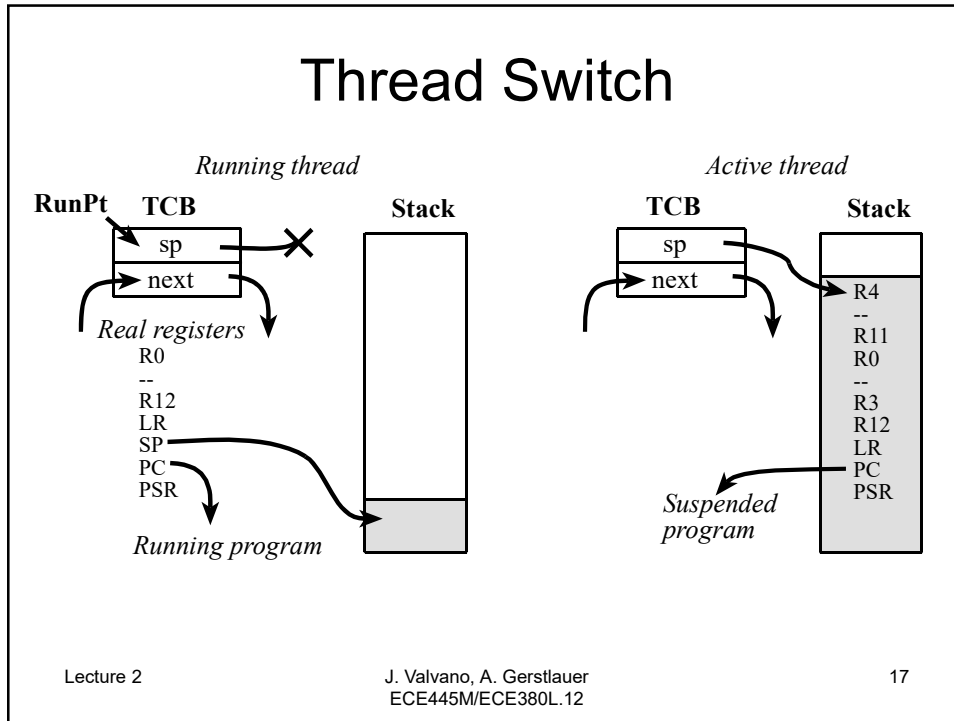

Look at TCB of uC/OS-II, `struct os_tcb` in  
Micrium\Software\uCOS-II\Source\ucos\_ii.h

Lecture 2

J. Valvano, A. Gerstlauer  
ECE445M/ECE380L.12

## PendSV Thread Switch (1)

- PendSV handler
  - Give PendSV handler lowest priority
    - Prevent switching out background tasks
  - Use C code to find next thread

TCB of a running thread
TCB of a thread not running

- Trigger PendSV
 

NVIC\_INT\_CTRL\_R = 0x10000000;

```

                ContextSwitch
                LDR    R0, =NVIC_INT_CTRL
                LDR    R1, =NVIC_PENDSVSET
                STR    R1, [R0]
                BX    LR
            
```

Page 160 of tm4c123gh6pm.pdf

## PendSV Thread Switch (2)

- 1) Disable interrupts
- 2) Save registers R4 to R11 on the user stack
- 3) Save stack pointer into TCB
- 4) Choose next thread
- 5) Retrieve new stack pointer
- 6) Restore registers R4 to R11
- 7) Reenable interrupts
- 8) Return from interrupt

Run *Testmain1*  
 -Show TCB chain  
 -Show stacks  
 -Explain switch

Micrium\Software\uCOS-III\Ports\ARM-Cortex-M3\Generic\RealView\Wos\_cpu\_a.asm

## Assembly Thread Switch

```

PendSV_Handler          ; 1) Saves R0-R3,R12,LR,PC,PSR
    CPSID I              ; 2) Make atomic
    PUSH {R4-R11}       ; 3) Save remaining regs r4-11
    LDR R0, =RunPt      ; 4) R0=pointer to RunPt, old
    LDR R1, [R0]         ; R1 = RunPt
    STR SP, [R1]         ; 5) Save SP into TCB
    LDR R1, [R1,#4]     ; 6) R1 = RunPt->next
    STR R1, [R0]         ; RunPt = R1
    LDR SP, [R1]         ; 7) new thread SP; SP=RunPt->sp;
    POP {R4-R11}        ; 8) restore regs r4-11
    CPSIE I              ; 9) tasks run enabled
    BX LR                ; 10) restore R0-R3,R12,LR,PC,PSR
    
```

ECE445M/ECE380L.12 21

## Thread Scheduler

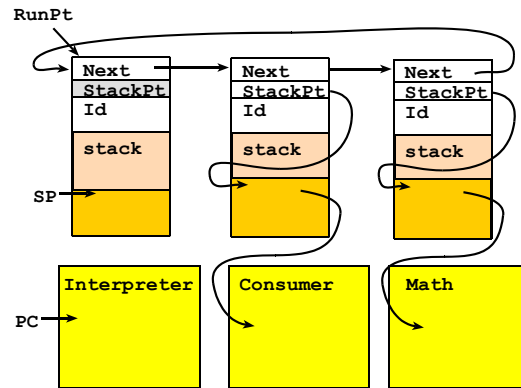

- When to invoke
  - Cooperative: `OS_Suspend()`
  - Preemptive: `SysTick`
- What **Active** task to **Run**
  - Round robin (Lab 2)
  - Weighted round robin
  - Priority (Lab 3)

Lecture 2 J. Valvano, A. Gerstlauer  
ECE445M/ECE380L.12 22

# Round Robin Scheduler

```
OS_AddThread(&Interpreter);
OS_AddThread(&Consumer);
OS_AddThread(&Math);
OS_Launch(TIMESLICE); // doesn't return
```

RunPt

23

# Thread States

Lab 3 will add Blocked

Lecture 2

J. Valvano, A. Gerstlauer  
ECE445M/ECE380L.12

24

# ARM Modes and Levels

**Thread mode**      Used to execute application software. The processor enters Thread mode when it comes out of reset.

**Handler mode**    Used to handle exceptions. The processor returns to Thread mode when it has finished exception processing.

The *privilege levels* for software execution are:

**Unprivileged**    The software:

- Has limited access to the MSR and MRS instructions, and cannot use the CPS instruction
- Cannot access the system timer, NVIC, or system control block
- Might have restricted access to memory or peripherals.

*Unprivileged software executes at the unprivileged level.*

**Privileged**        The software can use all the instructions and has access to all resources.

*Privileged software executes at the privileged level.*

Lecture 2
J. Valvano, A. Gerstlauer  
ECE445M/ECE380L.12
25

# ARM Registers (1)

Open debugger to see these registers

Thread mode  
- Main stack (MSP)  
- Process stack (PSP)  
Handler mode  
- Main stack (MSP)

MRS Rx, <special>  
MSR <special>, Rx

Lecture 2
J. Valvano, A. Gerstlauer  
ECE445M/ECE380L.12
26

# ARM Registers (2)

## General-purpose registers

R0-R12 are 32-bit general-purpose registers for data operations.

**AAPCS:**  
**R0-R3** parameters/return  
**R4-R11** must be saved

## Stack pointer

The *Stack Pointer* (SP) is register R13. In Thread mode, bit[1] of the CONTROL register indicates the stack pointer to use:

- 0 = *Main Stack Pointer* (MSP). This is the reset value. **Which SP is active?**
- 1 = *Process Stack Pointer* (PSP).

On reset, the processor loads the MSP with the value from address 0x00000000.

## Link register

**R14 is important**

The *Link Register* (LR) is register R14. It stores the return information for subroutines, function calls, and exceptions. On reset, the processor loads the LR value 0xFFFFFFFF.

## Program counter

The *Program Counter* (PC) is register R15. It contains the current program address. Bit[0] is always 0 because instruction fetches must be halfword aligned. On reset, the processor loads the PC with the value of the reset vector, which is at address 0x00000004.

# CONTROL Register

Figure 8. CONTROL bit assignments

Table 10. CONTROL register bit definitions

Bits	Function
Bits 31:2	Reserved
Bit 1	<b>ASPSEL:</b> Active stack pointer selection Selects the current stack: 0: MSP is the current stack pointer 1: PSP is the current stack pointer. In Handler mode this bit reads as zero and ignores writes.
Bit 0	<b>TPL:</b> Thread mode privilege level Defines the Thread mode privilege level. 0: Privileged 1: Unprivileged.

**Reset debugger:**  
 - look at CONTROL  
 - stop in ISR and  
 - look at CONTROL

# Exception Processing

Exception number	IRQ number	Offset	Vector
83	67	0x014C	IRQ67
.	.	.	.
.	.	.	.
18	2	0x004C	IRQ2
17	1	0x0048	IRQ1
16	0	0x0044	IRQ0
15	-1	0x0040	Systick
14	-2	0x003C	PendSV
13		0x0038	Reserved
12			Reserved for Debug
11	-5	0x002C	SVCall
10			Reserved
9			Reserved
8			Reserved
7			Reserved
6	-10	0x0018	Usage fault
5	-11	0x0014	Bus fault
4	-12	0x0010	Memory management fault
3	-13	0x000C	Hard fault
2	-14	0x0008	NMI
1		0x0004	Reset
		0x0000	Initial SP value

Remember - Systick is 15

## Stacking

### Define

Group priority 0-15

Subpriority

Nested exceptions

Tail chaining

Late arrival

Return

## Stack (8 regs):

- R0-R3, R12
- LR
- Return address
- PSR

## LR=EXC\_RETURN

0b11110001 Ret to Handler MSP

0b11111001 Ret to Thread MSP

0b11111101 Ret to Thread PSP

0b1110xxxx means floating point

aligned to double-word address

## Run debugger:

- stop in ISR and
- look at LR
- draw stack frame

# Program Status Register (PSR)

Figure 3. APSR, IPSR and EPSR bit assignments

Q = saturation

Figure 4. PSR bit assignments

T = Thumb bit

## Interrupt Program Status Register (IPSR)

Bits	Description
Bits 31:9	Reserved
Bits 8:0	<b>ISR_NUMBER:</b> This is the number of the current exception: 0: Thread mode 1: Reserved 2: NMI 3: Hard fault 4: Memory management fault 5: Bus fault 6: Usage fault 7: Reserved .... 10: Reserved 11: SVCall 12: Reserved for Debug 13: Reserved 14: PendSV 15: SysTick 16: IRQ0 <sup>(1)</sup> ....

Run debugger:  
- stop in ISR and  
- look at IPSR

Figure 2-3, The IPSR Register.

Lecture 2

J. Valvano, A. Gerstlauer  
ECE445M/ECE380L.12

31

## Execution Program Status Register (EPSR)

The Execution PSR (**EPSR**) contains two overlapping fields:

- the Interruptible-Continuable Instruction (ICI) field for interrupted load multiple and store multiple instructions PUSH {r4-r6,lr}
- the execution state field for the If-Then (IT) instruction, and the T-bit (Thumb state bit).

Figure 2-4, The EPSR Register.

Lecture 2

Lecture 2

J. Valvano, A. Gerstlauer  
ECE445M/ECE380L.12

35

## Supervisor Call (svc)

### 3.9.10 SVC

Supervisor Call.

#### Syntax

```
SVC(cond) #imm
```

where:

- '*cond*' is an optional condition code, see [Conditional execution on page 56](#).
- '*imm*' is an expression evaluating to an integer in the range 0-255 (8-bit value).

#### Operation

The SVC instruction causes the SVC exception.

*imm* is ignored by the processor. If required, it can be retrieved by the exception handler to determine what service is being requested.

#### Condition flags

This instruction does not change the flags.

#### Examples

```
SVC 0x32 ; Supervisor Call (SVC handler can extract the immediate value
; by locating it via the stacked PC)
```

Lecture 2

J. Valvano, A. Gerstlauer  
ECE445M/ECE380L.12

36

## Decisions

- PendSV/SysTick or SysTick only?
  - Everything in one handler?
    - How to handle sleep and time keeping?
- Privileged/Unprivileged or Privileged?
  - Trap or regular function call?
    - How do you link OS to user code?
- MSP/PSP or MSP?
  - Protection versus speed?
    - Check for stack overflow
    - Check for valid parameters

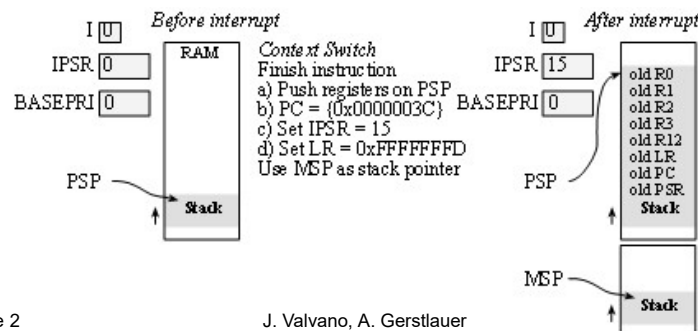

Lecture 2

J. Valvano, A. Gerstlauer  
ECE445M/ECE380L.12

37

## Thread Switch with PSP (1)

- Bottom 8 bits of LR
  - 0xE1 11110001 Return to Handler mode MSP (using floating point state)
  - 0xE9 11101001 Return to Thread mode MSP (using floating point state)
  - 0xED 11101101 Return to Thread mode PSP (using floating point state)
  - 0xF1 11110001 Return to Handler mode MSP
  - 0xF9 11111001 Return to Thread mode MSP
  - **0xFD 1111101 Return to Thread mode PSP**

41

## NVIC

- Set priorities
  - PendSV low
  - Timer1 high
- Trigger PendSV
 

```
NVIC_INT_CTRL_R
```

Page 160 of tm4c123gh6pm.pdf

## Launch

- Set SysTick period
- Set PendSV priority
- Using RunPt
  - Pop initialize Reg
- Enable interrupts
- Branch to user

Lecture 2

J. Valvano, A. Gerstlauer  
ECE445M/ECE380L.12

42

## To do first (1)

- Debugging
- Interrupts
- OS\_AddThread
- Assembly
- NVIC
- PendSV
- OS\_Suspend
- OS\_Launch

## To do last (2)

- Stack size
- FIFO size
- SysTick period
- PSP
  - Just use MSP
- OS\_Sleep
- OS\_Kill
- Semaphores

Lecture 2

J. Valvano, A. Gerstlauer  
ECE445M/ECE380L.12

43

## Lab 2 Part 1 (1)

- Debugging
  - How to breakpoint, run to, dump, heartbeat
- Interrupts
  - How to arm, acknowledge, set vectors
  - What does the stack look like? What is in LR?
- OS\_AddThread
  - Static allocation of TCBs and Stack
  - Execute 1,2,3 times and look at TCBs and Stack
- Assembly
  - PendSV, push/pull registers, load and store SP
  - Enable, disable interrupts
  - Access global variables like RunPt

Lecture 2

J. Valvano, A. Gerstlauer  
ECE445M/ECE380L.12

44

## Lab 2 Part 1 (2)

- NVIC
  - Arm/disarm, priority
- PendSV
  - How to trigger
  - Write a PendSV handler to switch tasks
- OS\_Suspend (scheduler and PendSV)
- OS\_Launch
  - Run to a line at the beginning of the thread
  - Make sure TCB and stack are correct

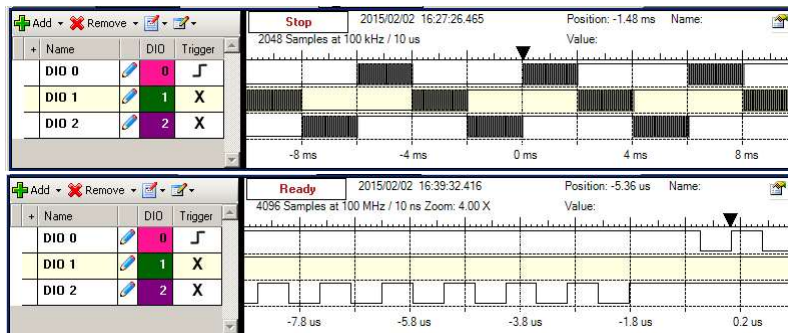

Lecture 2

J. Valvano, A. Gerstlauer  
ECE445M/ECE380L.12

45

## Debugging tips

- Visualize the stacks
- Dumps and logs
- Logic analyzer

Lecture 2

J. Valvano, A. Gerstlauer  
ECE445M/ECE380L.12

46

## Aperiodic Tasks (1)

- Switch debouncing
  - Assume a minimum touch time 500ms
  - Assume a maximum bounce time 10ms
- On touch
  - Signal user, call user function (no latency)
  - Disarm. **AddThread(&BounceWait)**
- BounceWait
  - Sleep for more than 10, less than 500 ms
  - Rearm. **OS\_Kill()**

Lecture 2

J. Valvano, A. Gerstlauer  
ECE445M/ECE380L.12

47

## Aperiodic Tasks (2)

- Switch debouncing
  - Assume a maximum bounce time 10ms
- Interrupt on both rise and fall
  - If it is a rise, signal touch event
  - If it is a fall, signal release event
  - Disarm. **AddThread(&DebounceTask)**
- DebounceTask
  - Sleep for 10 ms. **OS\_Sleep(10)**
  - Rearm, Set a global with the input pin value
  - **OS\_Kill()**

Define latency for this interface

Lecture 2

J. Valvano, A. Gerstlauer  
ECE445M/ECE380L.12

48

## Switch Debounce

```

void static DebounceTask(void) {
    OS_Sleep(10); // foreground sleeping, must run within 50ms
    LastPD6 = PD6; // read while it is not bouncing
    GPIO_PORTD_ICR_R = 0x40; // clear flag6
    GPIO_PORTD_IM_R |= 0x40; // enable interrupt on PD6
    OS_Kill();
}
void GPIOPortD_Handler(void){
    if(LastPD6 == 0) // if previous was low, this is rising edge
        (*PD6Task)(); // execute user task
    GPIO_PORTD_IM_R &= ~0x40; // disarm interrupt on PD6
    OS_AddThread(&DebounceTask);
}

```

Quiz 1, Question 9,  
Spring 2012

## Summary

- Threads are executing software tasks
- RTOS has unique requirements
  - Reliability
  - Real-Time
  - Priority
  - Certification
  - Runs in ROM
