* Formerly with ATK

DISTRIBUTION NOTICE: THE DATA CONTAINED HEREIN HAS BEEN REVIEWED AND
APPROVED FOR PUBLIC RELEASE - DISTRIBUTION UNLIMITED. CASE #SN-07-0181

Government Disclaimer Notice

When the Government provided drawings or data are used for any purpose other than in connection with a definitely related Government Procurement Operation, the United States Government thereby incurs no responsibility nor any obligation whatsoever, and the fact that the Government may have formulated, furnished, or in any way supplied the said drawings or data, is not to be regarded by implication or otherwise as in any manner licensing the holder or any other person or corporation or conveying any rights or permission to manufacture, use, or sell any patented invention that may in any way be related thereto.

Acknowledgements

- **Dr. Nicole Evers (General Electric)**
 - GE windmill geometry CAD files
- **DoD High Performance Computing Modernization Program**
 - High performance computers (SGI Origin)

Outline

- **Objective of modeling effort**
- **Develop modeling procedure**
 - Generate geometry
 - Run CEM code
 - Generate RCS plots and Spectrograms
- **Validate modeling procedure**
 - L, S, C, X-band
 - Representative azimuth angles
 - Multiple elevation angles
 - L,S: -10° , -5° , 0° , 5° , 10°
 - C,X: 0° only
- **Examine tradeoffs**
 - Multiple mesh densities
 - Entire geometry vs. only rotational parts
 - Sampling rate of rotational angles
 - Max Doppler estimation
- **Summary**

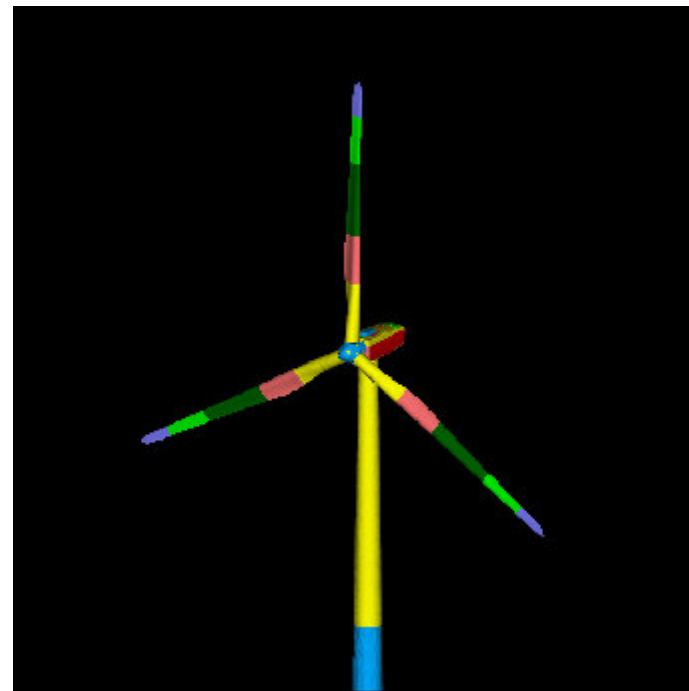

Objective of Windmill Modeling Effort

Determine if CEM tools can be used for new windmill designs with sufficient confidence to

- Assess RF environment impacts
- Avoid future need for field testing

General Electric Windmill

Windmill Model

Windmill Modeling

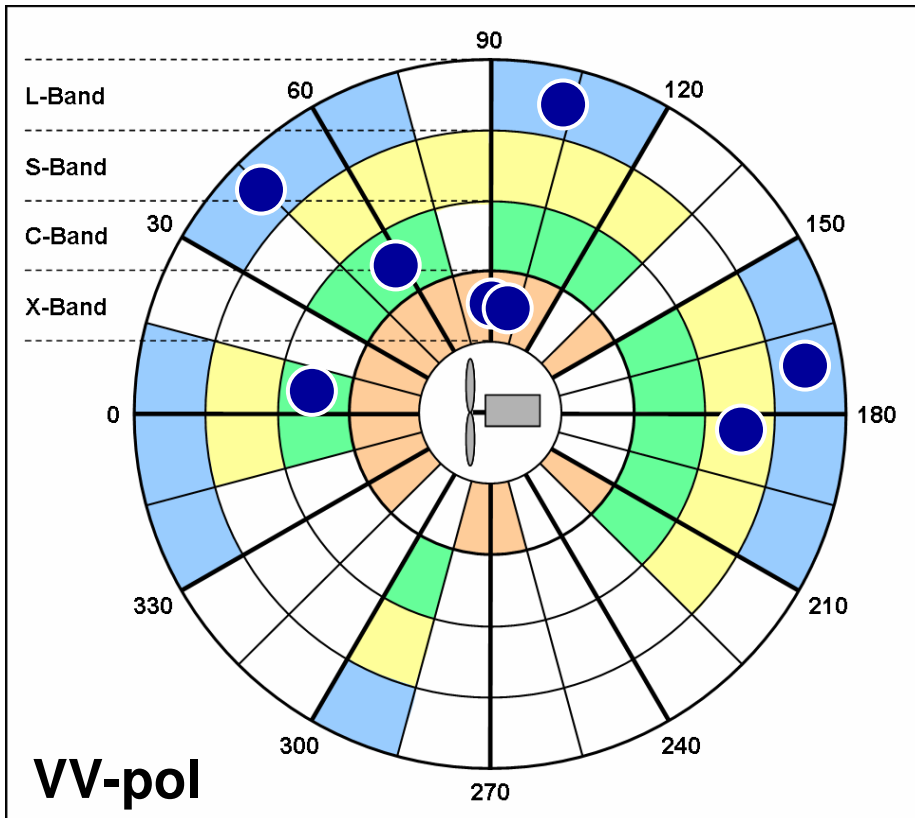

CEM predictions need to be accurate and timely.

- **Accurate --- Can prediction reproduce measured data?**
 - Validate prediction with available measured data
 - Multiple bands: L, S, C, and X band
 - Multiple angles: azimuth and elevation
- **Timely --- Can we trade accuracy for speed?**
 - Do we need all the geometry fidelity?
 - True geometry with fine, medium, and coarse meshes
 - True geometry vs. simplified hub/nacelle/tower
 - Can we neglect blades and tower interaction?
 - Full geometry vs. rotational parts only
 - Can we reduce the blade rotational sampling rate?
 - 3 times Nyquist rate vs. 2 times Nyquist rate
 - Can we estimate the maximum Doppler frequencies?
 - Use a simple formulation

Windmill Modeling Matrix

Use available measured data to validate predictions

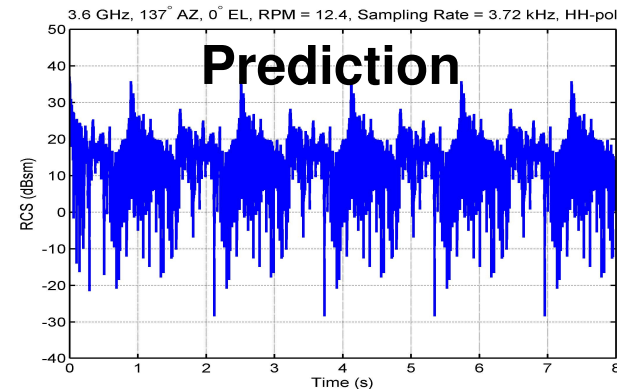

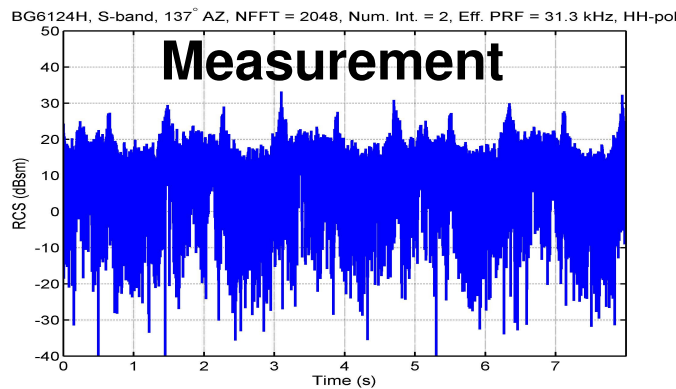

● Selected Prediction Angles and Frequencies

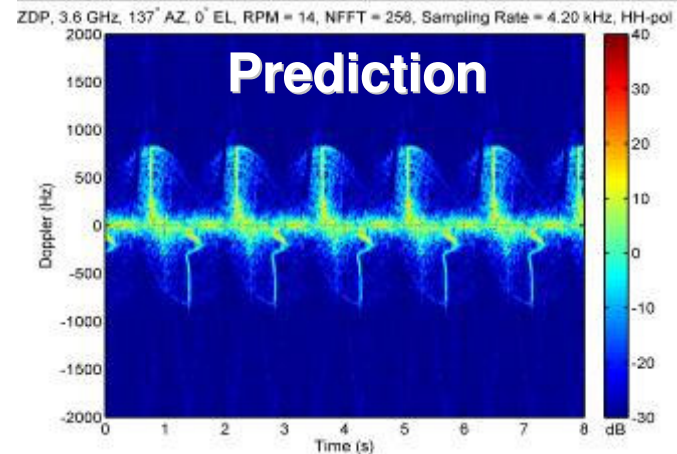

Windmill Modeling Validation

Compare measurement and prediction

– Radar cross section (RCS) versus time

– Spectrograms (Doppler spectra versus Time)

CEM Prediction Tools

- **ACAD (CAD/mesh generation tool) is capable of producing**
 - High precision geometrical entities
 - High quality meshes suitable for CEM simulations

- **Xpatch (RCS prediction tool) is suitable for electrically large targets**
 - Windmill is electrically large even at the lowest frequency of interest
 - GE 34a blade is 170λ long at 1.5 GHz
 - Tower is 325λ long at 1.5 GHz

Windmill Modeling Procedure

- **Generate geometry input**
 - Obtain CAD model in “standard” file formats (STEP and IGES) from General Electric
 - Rebuild CAD model and generate mesh in **ACAD**
- **Material input assumption**
 - Physical blades made of composite materials
 - Assume metal blades for computation
- **Run CEM codes**
 - Predict RCS using the **Xpatch** code on SGI Origin 3900 computer systems
 - Include the effect of blades and tower interaction
 - Assume no traveling wave, surface wave, etc.
- **Generate output products**
 - RCS vs. time plots
 - Spectrogram

Generate Geometry Input

Generate Geometry Input Problem with CAD Geometry

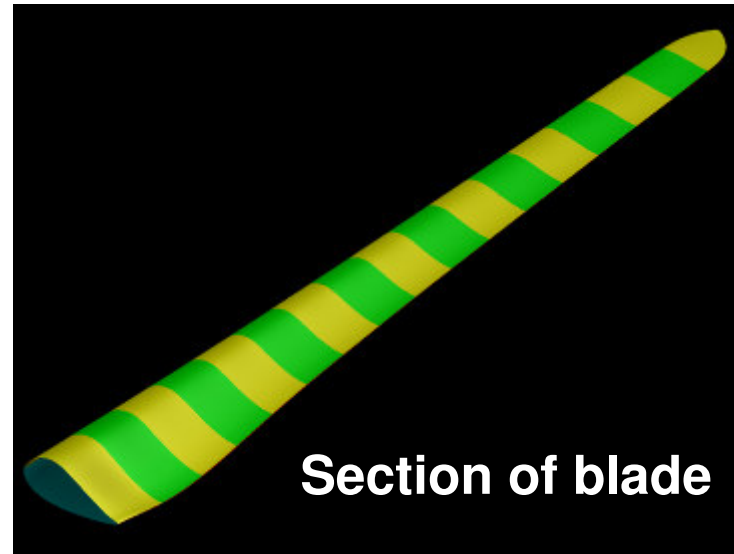

Generate Geometry Input Lofting Surfaces in ACAD

Generate Geometry Input

Rebuilt Blade in ACAD – Surface Needs to be Watertight

Generate Geometry Input Rebuilt Blade in ACAD

All surfaces have been assembled in
ACAD. Model is now watertight.

Generate Geometry Input Mesh of a Blade

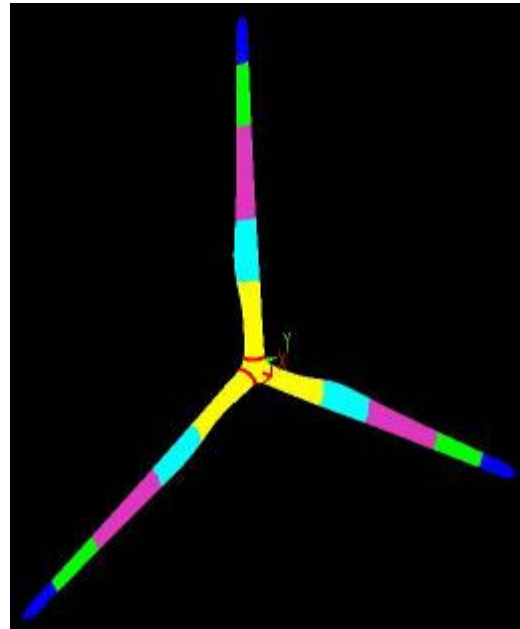

Generate Geometry Input Problem with Nacelle and Hub

Even with extreme care, a mesh was not obtainable due to many “bad” surfaces with tiny slivers and overlaps.

Gaps < 0.000001 m !

Generate Geometry Input Hub and Blades Mesh

Generate Geometry Input Nacelle Mesh

Generate Geometry Input Nose Cone Mesh

Generate Geometry Input Tower Mesh

Generate Geometry Input Windmill Mesh

95% of imported models were rebuilt from basic entities such as points and splines!

Meshes of different densities can now be easily generated with the reconstructed geometry.

Generate Geometry Input Actual vs. ACAD Model

Actual GE Wind Turbine

ACAD Model

Generate Geometry Input Meshes Statistics

No. of facets	Mesh 1 (Coarse)	Mesh 2 (Medium)	Mesh 3 (Fine)
Nose Cone	2,641	7,293	15,543
Hub & Blades	56,586	140,514	279,284
Nacelle	18,774	45,588	86,098
Tower (fixed mesh)	22,730	22,730	22,730
Total	100,731	216,125	403,655

Generate Geometry Input Meshes Statistics

Run CEM Code - Xpatch

Blade Rotational Symmetry

Need to compute only 0° to 120° rotation angles.

0° Rotation Angle

Blade Rotational Symmetry

Need to compute only 0° to 120° rotation angles.

30° Rotation Angle

Blade Rotational Symmetry

Need to compute only 0° to 120° rotation angles.

60° Rotation Angle

Blade Rotational Symmetry

Need to compute only 0° to 120° rotation angles.

90° Rotation Angle

Blade Rotational Symmetry

Need to compute only 0° to 120° rotation angles.

120° Rotation Angle

Blade Rotation Minimum Requirements

- To capture multi-bounces, sampling rate needs to be **at least twice** the Nyquist sampling rate.
- **RPM can cause significant change in Doppler Frequency!**

- **Nyquist sampling rate**

- L-band: 1,500 angles
- S-band: 3,428 angles
- C-band: 6,000 angles
- X-band: 12,000 angles

- **Computed *sampling rate***

- L-band: 4,800 angles (every 0.025°)
- S-band: 6,000 angles (every 0.02°)
- C-band: 12,000 angles (every 0.01°)
- X-band: 24,000 angles (every 0.005°)
 - Still being computed

$$\text{Doppler Freq} = \frac{2 \times \text{Radial Velocity}}{\text{Wavelength}}$$

Validation:
Compare Measured and Xpatch Predicted
RCS vs. Time

L-Band – Coarse Mesh with 4,800 blade rotations

S-Band – Coarse Mesh with 6,000 blade rotations

C-Band – Coarse Mesh with 12,000 blade rotations

Note: Measured and Predicted data are zero-Doppler filtered

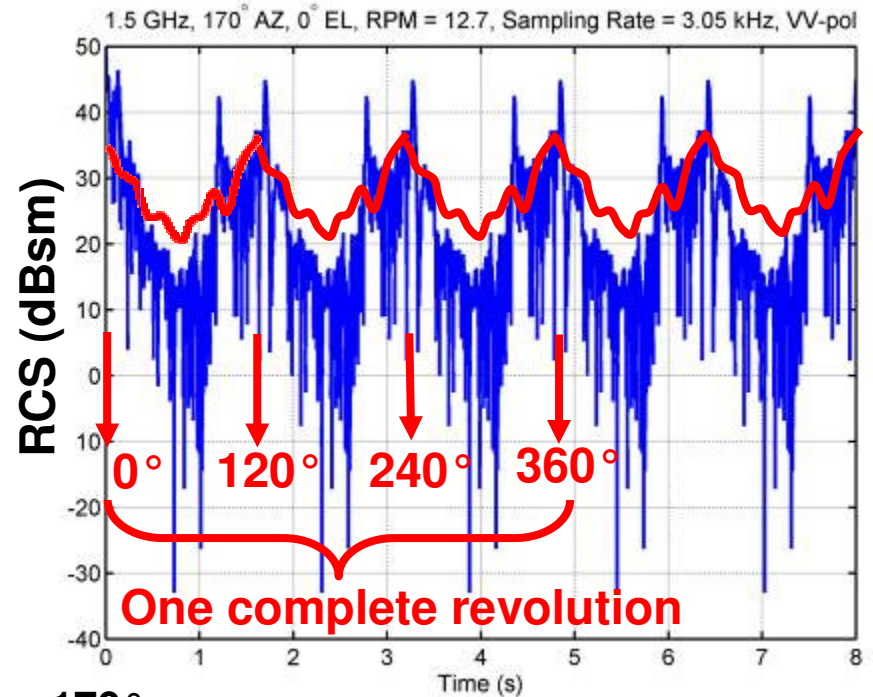

Measured vs. Predicted RCS

L-band, 170° AZ, 0° EL, RPM = 12.7, VV-pol

- Prediction captures the measurement pattern
- Predicted RCS levels comparable with measured RCS
- Spikes in the prediction are artifact due to coarse mesh sampling
- Elevation and pitch angles differ for measurement and prediction
- Fiberglass was modeled as metal in prediction

Measured

Xpatch

Measured vs. Predicted RCS

L-band, 0° AZ, 0° EL, RPM = 12.5, HH-pol

- Prediction captures the measurement pattern
- Blades are flexible in measurement but fixed in prediction
- Elevation and pitch angles differ for measurement and prediction.
- Fiberglass was modeled as metal in prediction

Measured

Xpatch

Measured vs. Predicted RCS

S-band, 137° AZ, -5° EL, RPM = 12.4, HH-pol

- Prediction captures the measurement pattern
- RCS levels within measurement uncertainty
- Elevation and pitch angles differ for measurement and prediction.
- Fiberglass was modeled as metal in prediction

Measured

Xpatch

Measured vs. Predicted RCS

C-band, 42° AZ, 0° EL, RPM = 12.4, VV-pol

- Prediction captures the measurement pattern
- RCS level within measurement uncertainty
- Pitch angles changed during measurement

Measured

Xpatch

Maximum Doppler estimate **NOT** accurate near 0° AZ

Summary (1)

- **Geometry preparation is tedious and time consuming**
- **Spectrogram captures major Doppler effects with only**
 - Using a very coarse geometry mesh
 - Sampling at Nyquist rate
 - Simplifying hub/nacelle/tower geometry
 - Including only rotating parts
- **Prediction can produce accurate RCS, but can be improved with**
 - a more precise geometry
 - finer mesh
 - known pitch angle
 - higher rotational angle sampling rate
 - actual material and internal structure
- **Knowledge of radar systems crucial in determining prediction accuracy requirements**

Summary (2)

Measurement vs. Prediction

- **Measurement**

- Can measure “as built” configuration
- Include all RF effects
- Includes dynamic effects of bending and twisting of composite blades

- **Prediction**

- Is not limited to certain azimuth and elevation angles
- Is not limited by weather and measurement equipment availability
- Can predict systems before they are built
