First, a word about Covid 19

I strongly prefer teaching in person. I believe it is a much better vehicle for explaining difficult concepts since among other things I can more easily tell when students are not getting it and can adjust my explanations accordingly. Unfortunately, with 95 students enrolled in 460N this semester, the risk of serious illness is just too high if we tried to do this on campus. So we will be using Zoom.

A few things I hope will help. First, all lectures will be recorded and made available to you, so if you need to, you can replay any part of any of my lectures. Hopefully that will help. Second, I will have two kinds of office hours. Right after class each Monday and Wednesday, I will be on Zoom to answer your questions. If you have no questions, you are still welcome to connect and just listen to other students' questions and my answers. No way I could do that in my office in EER. 95 students won't fit! But with Zoom, you are free to join or not as you find useful.

Some of you may want to meet privately with me. I will try to make myself available as much as possible to do that over Zoom. If you send me an email, I will try to schedule a time when just the two of us can meet. Please do not hesitate if you find it useful. Taking 460N on-line may be stressful at times, and I want to make myself available to talk to you if you need to before the stress gets too great if possible.

Also, I want to encourage you even more than I have in the past to form a study group to study the material of the course, work the problems in the problem sets together. I have found that doing so benefits all students in the study group. Also, if your study group wants to meet with me privately, I am happy to do that.

Finally, because we are using Zoom, we are somewhat at the mercy of the
internet. Outages may happen, and we will have to deal with them if they do. If you run into any such problems, please contact me or one of my TAs. We will do our best to be accommodating.

So, welcome to 460N. I wish we were doing this in person, but it is far beyond my control. I will do my best to help you master the concepts of 460N this semester. Good luck, and stay safe.

Course Overview

This course, in my view, represents a serious introduction at a senior undergraduate level into how computers work. I believe that Computing involves architecture at many levels. We will focus on the instruction set architecture level (sometimes called the machine architecture) and the microarchitecture level (often called the implementation architecture or computer organization).

We will review to some extent the level below the microarchitecture (the logic design level), relying mainly on knowledge you already have obtained, and we will cover to some extent the level above the instruction set architecture (program translation) in order to demonstrate our understanding of some of the concepts. The intent of the course is to provide a comprehensive understanding of how the various levels play together, and remove a good part of the mystery pertaining to how the machine works.

A separate handout contains a lecture by lecture outline of the course, along with dates for all assignments, quizzes and the final exam.

What I expect: I expect to assign a substantial number of homework problems and in addition six programming assignments. I hope to cover most of the material one should expect in an introduction to computer organization, but I expect to not read to you from any textbook. You should consider my lectures and the corresponding treatments in various textbooks as different approaches to learning the same material. The problem sets are a way for you to check to see if you are getting it.

I will not take attendance, and attendance will not be considered in the grading. At this point in your education, I believe it is for you to decide how to allocate your time. You must decide whether I am providing enough that is useful in class to justify your coming to class.

I encourage you to study in groups, and to come to my "office" in groups. That usually will result in all of you understanding the material better. You are encouraged to ask questions, ...after you have thought about the material. You are encouraged to challenge assumptions. Computer Science
and Engineering deals with "nature" that is man-made (person-made, actually, but that is awkward) and so we the people may have made it wrong. I tend to respond thoroughly (usually too thoroughly, I am often told) to questions, using the question as an opportunity to introduce new material. You, working with other members of your study group, can often unravel my response to the benefit of all members of the group much better than one person can, working alone.

If you are part of a study group, you will need to turn in only one copy of a solution to a problem set for the entire group. The front page should contain the names of all members of the study group who have contributed to the solution. Each student will receive the same grade for that problem set.

In the spirit of learning from each other, you are invited to work together with one other person on the first two programming labs. If you choose that option, only one copy of the program solution should be turned in, but both of your names should be clearly stated on your submission. You will both receive the same grade on those two programming labs.

Although I encourage you to study together, examinations and your work on programming lab assignments 3, 4, 5, and 6 must be your own individual work.

**Meeting Info**

The course consists of three hours of lecture + a 1 1/2 hour discussion session each week. Lectures will generally take place MW, from 5pm to 6:30pm over Zoom. The compile-time schedule of lectures and discussions can be found in the Course Syllabus, although it could change depending on how rapidly (or slowly) we cover various topics. When faced with answering a student question or remaining on schedule, I almost always opt for answering the question. Thus, the dynamic schedule of my lectures will probably not be known until run-time, since we are likely to adapt the schedule where it seems to make sense.

There will be four discussion sections each week, as follows:

- **16420** F 1:30pm - 3:00pm
- **16425** F 3:00pm - 4:30pm
- **16430** TH 3:30pm - 5:00pm
- **16435** TH 5:00pm - 6:30pm
Students are free to attend any discussion section they choose. Also, students are free to switch discussion sections as often as they wish during the semester.

**Teaching Assistants**

Chester Cai, Sean Stephens, Arjun Ramesh

**Course Home Page**

http://users.ece.utexas.edu/~patt/20f.460n/

**Textbook**

There is no required textbook for the course. I will make available as appropriate copies of notes I will use throughout the course. I am in the process of writing a textbook for 460N, which will become the required textbook when (if??) it gets done. If I have chapters ready for you, I will distribute those as appropriate in class.

Over the years, my TAs have noted terms that I have used in class, and I have compiled definitions of all of them into a file, which is located on the course web page under Handouts, as Glossary of Buzzwords. I admit that this is not a textbook. However, I have been told by students that it is a very valuable reference for the various concepts discussed in class. Each semester, my TAs bring me any terms (buzzwords) I have used for the first time, and I create entries for those terms in the Glossary.

In addition, three textbooks are identified below as containing useful information on the material covered in the course. If you find it useful, you may want to obtain a copy of one of them and share it with other members of your study group. In that way, each student can benefit from more than one author's interpretation of the material. Some students have successfully completed this course without ever looking at a textbook. Others have found it useful to purchase several textbooks. You should use your own best judgment on this.

The three textbooks are:

Prerequisites

The prerequisites for the class are EE 312 and EE 319K, with a grade of C- or higher in each class. It is also assumed that the student has facility in the programming language C. If you are not conversant in C, it is assumed that you are willing and able to pick up what you need to know to be able to complete the six programming lab assignments. You should feel very comfortable asking any TA any question about C.

Additional course resources

As noted above, class handouts will be supplied when necessary to supplement the concepts discussed in lecture. Other information will be downloadable from the course home page.

Homework policy

Problem sets will be assigned as specified in the syllabus. Additional problems may be assigned whenever the instructor feels it is appropriate, based on something that comes up in class. Usually, students will have between one and two weeks to complete a problem set. Students are strongly encouraged to form study groups to work homework problems. Only one copy of a problem set per group should be turned in.

Cheating

I strongly encourage you to form a study group of three or four students, and to work together on the problem sets and to study together to prepare for each exam. I also want you to work with your (one) partner on the first two programming labs. However, collaboration does NOT extend to the programming lab assignments 3, 4, 5, and 6, or to the two mid-terms and final exam. These programs and the examinations you take MUST be your own work. Providing information to another student where prohibited, or obtaining information from anyone other than the instructor or one of the TAs where prohibited is considered cheating. This includes the exchange of any information during an examination and any code that is part of a solution to a programming assignment. Allowing another student to read something on your paper during an examination is considered cheating. In fact, leaving information unprotected so it can be compromised by another student is considered cheating. This includes sheets of paper lying about in an examination room or in your home, and computer files that are not
properly protected. If you cheat, you violate the soul of the University, which I take very seriously, and I will deal with in the harshest possible way. If you have any question as to what is permitted and what is not, ask the instructor or a TA FIRST. If you don't ask first, and you do something that is not allowed, the response "I thought it was okay" is not an acceptable justification.

I am told that the programming labs from previous years are available to anyone who wants them on the web. I strongly urge you to not avail yourself of these lab solutions for several reasons: (a) The course is an elective, so presumably you are enrolled because you want to master this material. Looking at old solutions does not help accomplish that objective. (b) Cheating scripts have gotten pretty sophisticated over the years, and we do compare your lab solutions with those we find on the web, which almost always results in cheating being caught. (c) Anyone caught cheating will be dealt with severely. The penalty I will recommend to the Dean of Judicial Services is most likely an F in the course. Please do not force my hand on this. You will not be happy with the result.

The above paragraphs were written for previous semesters when all exams were taken in class. This semester you will take the exams in your apartment or dorm room, so there is a greater challenge to not cheat. I hope I am not expressing naivete in saying that I expect your signature on an exam saying you did not cheat reflects the fact that you took the exam in your apartment in the same way you would have if you were doing so in my classroom with my TAs and me roaming the aisles.

I am embarrassed to have to bother all of you with the above paragraphs since for most of you, they are totally unnecessary. But, every semester there are a few who feel it is okay to cheat, and I have to turn them in to the Student Judicial System. In an attempt to deter these few from cheating, I apologize for having to waste all this time of the rest of you.

**Quiz and Exam policy**

There will be two exams during class time, the first on October 7th, the second on November 18th. There will be a final exam during the normal final exam period, on Friday, December 11th, unless the Registrar changes the date. Please be sure to check the Registrar's schedule as we get closer to December 11th. The exam will be closed book, with two exceptions:

(1) The student may bring to the exam three sheets of paper on which the
student is free to write anything he/she wishes. All three sheets must be original sheets in the student's own handwriting.

(2) Each student may bring to the exam any handouts that have been expressly permitted by the instructor prior to the exam.

**Final Exam**

Probably Friday, December 11th, 7 to 10pm. (TENTATIVE). See above.

**Grading mechanics**

Nominally, grades are based on the following percentages:

- Problem sets: 10% (2.5% each, times 4 assignments)
- Programming Lab Experiments: 30% (5% each, times 6 assignments)
- Midterms: 15% each (two of them)
- Final exam: 25%
- My subjective evaluation of your work: 5%
- We will use +/- grading.

Policy: Problem sets and programming assignments are due on the date and at the time specified.

Make-up exams will be given only in extraordinary situations. Excused absence from an exam must be obtained in advance except under very rare circumstances.

**Additional details**

The CIS evaluation form will be used to evaluate the instructor in this course.

The deadline for dropping without possible academic penalty is October 29th for undergraduate students.

Allegations of Scholastic Dishonesty will be dealt with according to the procedures outlined in Appendix C, Chapter 11, of the General Information Bulletin, http://www.utexas.edu/student/registrar/catalogs/.

The University of Texas at Austin provides, upon request, appropriate academic adjustments for qualified students with disabilities. For more information, contact the Office of the Dean of Students at 512-471-6259, 512-471-4241 TDD, or the College of Engineering Director of Students with Disabilities, 512-471-4321.
For those of you who decide to continue in this course, Good Luck. I hope you find the experience an important part of your computer engineering education. I also hope you have a good time doing it.

Finally, I have been asked by the University to add these three items to the Course Descriptor:

1. On academic dishonesty. Please see the UT Honor Code:

http://catalog.utexas.edu/general-information/the-university/#universitycodeofconduct

2. On accommodations for religious holidays. By UT Austin policy, you must notify me of your pending absence at least fourteen days prior to the date of observance of a religious holy day. If you must miss a class, an examination, a work assignment, or a project in order to observe a religious holy day, you will be given an opportunity to complete the missed work within a reasonable time after the absence.”

* Occupants of buildings on The University of Texas at Austin campus are required to evacuate buildings when a fire alarm is activated. Alarm activation or announcement requires exiting and assembling outside.

* Familiarize yourself with all exit doors of each classroom and building you may occupy. Remember that the nearest exit door may not be the one you used when entering the building.

* Students requiring assistance in evacuation shall inform their instructor in writing during the first week of class.

* In the event of an evacuation, follow the instruction of faculty or class instructors.

* Do not re-enter a building unless given instructions by the following: Austin Fire Department, The University of Texas at Austin Police Department, or Fire Prevention Services office.

* Behavior Concerns Advice Line (BCAL): 512-232-5050

* Link to information regarding emergency evacuation routes and emergency procedures can be found at: http://www.utexas.edu/emergency.
